Pulsegrid (Series A)

We're remote-first with a hub in Shoreditch, London | www.pulsegrid-example.io

Founding Full-Stack Engineer (#14)

Reference: REF: PG-ENG-014

Location:	Remote-first (UK/EU timezone) — optional hub in Shoreditch
Team:	Engineering (you'd be engineer #14, company #31)
Reports to:	CTO / Co-founder
Contract:	Permanent, Full-time
Comp:	£85k–£110k + meaningful equity (0.1–0.4%) + annual refresh grants
Start date:	ASAP. No, really.

About Us

Pulsegrid is building real-time energy orchestration for commercial buildings — think of it as an operating system that decides, second by second, when buildings should store, shift or shed power. We raised a $14M Series A last quarter, we've tripled ARR in nine months, and we're onboarding buildings faster than we can ship features. We deploy to production multiple times a day, we kill our darlings weekly, and last quarter's roadmap is a museum piece. If you need certainty, this is not your job. If you want to see your code running a city's worth of buildings within a month, read on.

The Role

You'll own product surfaces end-to-end: our live operations dashboard (React/TypeScript), the customer APIs (Go), and the data pipelines feeding them (Kafka, TimescaleDB). You'll talk directly to customers, ship behind feature flags, and make calls with incomplete information. Some weeks you'll write a customer-facing feature from Figma to prod by Thursday. Some weeks you'll be elbow-deep in a gnarly latency bug at 2am because a grid operator in another timezone depends on us. Both weeks count.

Key Responsibilities

- Design, build and ship full-stack features across React/TypeScript frontend and Go backend services
- Own services in production: observability, alerting, on-call participation (1 week in 6, compensated)
- Work directly with founders and customers to shape what we build next — roadmaps here are 6 weeks, not 6 months
- Scale our event-driven data platform (Kafka, TimescaleDB, Redis) as connected buildings grow 10x this year
- Write RFCs, review code generously, and leave the codebase better than you found it (mostly)
- Help interview and onboard the next ten engineers — you are the early culture
- Occasionally demo to investors, grid operators, and one very demanding pilot customer

Essential Requirements

- 4+ years shipping production software, with strong experience in TypeScript/React and at least one backend language (Go preferred, Rust/Node/Java fine)
- You've operated services in production: metrics, tracing, incident response, the 2am page
- Comfort with ambiguity and velocity — you ship, learn and iterate rather than wait for perfect specs

- Solid grasp of distributed systems fundamentals: queues, idempotency, consistency trade-offs
- Excellent communication — you can explain a technical trade-off to a customer and a founder in the same breath
- Genuine excitement about energy, climate or hard real-world problems

Desirable (Not Essential)

- Experience with event-driven architectures (Kafka, NATS), time-series data, or streaming systems
- Energy sector domain knowledge (demand response, BMS/SCADA, Modbus — we'll teach you if not)
- Prior early-stage startup experience (you know what 'founding engineer' actually means)
- Open-source contributions or side projects you're proud of

What We Offer

- £85k–£110k base + 0.1–0.4% equity with a 10-year exercise window
- 33 days holiday (yes, we actually take them) + company-wide winter shutdown
- £3k/year learning budget, new laptop + £1k home office allowance
- Private health insurance, 6% pension, enhanced parental leave
- Quarterly offsites (last one was Lisbon, next one is a surprise — allegedly)
- The honest truth: it's intense, it's chaotic, and it's the steepest growth curve you'll find

How to Apply

Apply at pulsegrid-example.io/careers or email your CV/GitHub to join@pulsegrid-example.io with subject 'PG-ENG-014'. Process: intro call with our CTO (30 min) → take-home or pair session (your choice, max 3 hrs) → onsite/virtual half-day with the team. We aim to make offers within 10 days of first contact and we give feedback to everyone who interviews.

Closing date: Rolling — we're hiring 4 engineers this quarter and they will go fast
